

**AMENDMENTS TO THE SPECIFICATION**

Please amend paragraph [0004] as follows:

The formation of the micro-lenses is a relatively precise process. In order to increase the efficiency of the light gathering aspect of the micro-lenses, the micro-lenses should be as large as possible. Still, it is undesirable for the individual micro-lenses to contact each other and thereby interfere. In sum, it is desired that the micro-lenses be as close to each other as possible ~~with~~without touching.
